

TURNKEY IMPLEMENTATION AND COMMISSIONING

FOR DATA CENTRE INFRASTRUCTURES AND DATA NETWORKS

Datwyler's Turnkey Implementation and Commissioning services comprise:

- **Project management** of internal resources and external partners with a project plan, milestone planning, and regular reporting
- **Sourcing and logistics** as well as on-time delivery of hardware and software (to one or more locations)
- **Technical execution planning** down to the level of layout, splicing, patching, power distribution, etc.
- **Turnkey implementation** of the physical installation/configuration by qualified specialists
- Professional and comprehensive **digital documentation**
- **Testing** and quality assurance
- **Handover and Commissioning** of the fully functioning and tested system (with warranty)

The very complex tasks of installing, testing, and commissioning an IT infrastructure on an end user's site – be it a communications network or a data centre with racks, cabling, power distribution, cooling, and monitoring devices – need qualified staff and a significant amount of time. Organisations typically have neither the personnel nor the time for such activities because they do not count as core tasks.

Datwyler will happily take over day-to-day project management, coordinate logistics with different hardware suppliers – particularly if the installation requires a roll-out to different locations –, will assure quality throughout the installation phase, and hand over to the end customer a tested and functional solution on time and within budget under premium warranty conditions.

We will be happy to advise you personally.
